

I think there are something like 700,000 amateur radio operators in the US. There are a large number of us that are with the Amateur Radio Emergency Service. What's going to happen when the 2-80mhz spectrum is destroyed by the BPL interference?

That's right, it's going to move everyone up to the higher frequencies. Just like the cell phones get jammed up when the power and phone lines go down during an emergency. Is that what you want?

I thought we were trying to prevent things from happening. But it sounds like money is once again more important than anything else.

Please don't allow docket 03-104 to be implemented. The need for Emergency Communications may be your OWN!
